

Panel 1

$$f(x) = \frac{1}{2}(x_1^2 + 5x_2^2)$$

— $\tau = 0.15$

- - - $\tau = 0.37$

A larger step can oscillate
across the narrow direction

Panel 2

$$\tau_k \in \underset{\tau \geq 0}{\operatorname{argmin}} f(x_k - \tau \nabla f(x_k))$$

$$\langle \nabla f(x_k), \nabla f(x_{k+1}) \rangle = 0$$

$$f(x) = \frac{1}{2}(x_1^2 + 5x_2^2)$$
