

Larger norm: $\|\beta\| = 3$

$$f(x, \beta) = \theta(t \langle v, x \rangle)$$

Boundary: $\langle v, x \rangle = 0$

Smaller norm: $\|\beta\| = 1.4$

$$f(x, \beta) = \theta(t \langle v, x \rangle)$$

Boundary: $\langle v, x \rangle = 0$

The width is measured perpendicular to the same decision boundary in both panels.
